

To Change the Scenario \$/GJ Price follow these steps:

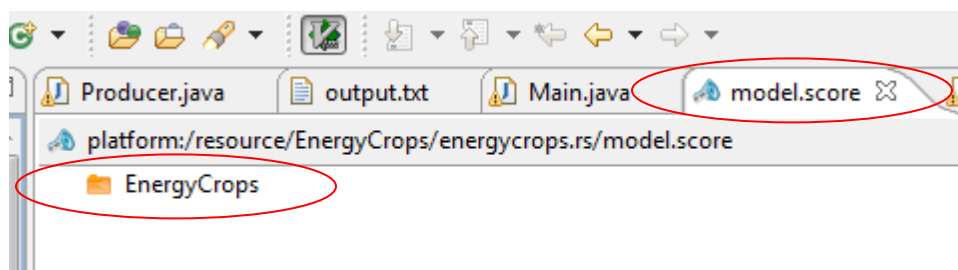

1. Open the model.score file java tab

Click on energycrop.rs file in the package explorer then double click model.score for it to open

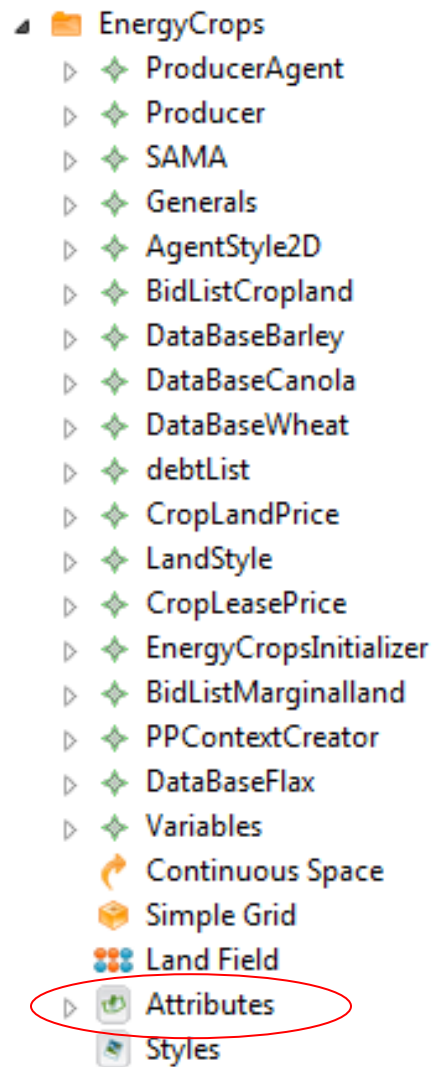

The model.score file tab will look like this once you open it.

You will need to open the EnergyCrops folder within the model.score file to make changes to different parameter variables. In this case we want to change the price of \$/GJ used in the simulation. We are looking for “gjprice”.

Then click on attributes to view all the parameters used in the simulation as shown in the picture below.

Right click on “gjprice” and select show properties. You should then have a Properties tab where you can change the \$/GJ price in the Default Value row. In the example below the current price is zero which is used in the base scenario . Here you enter the price you want to simulate.

The screenshot shows the IDE's Properties window for the variable 'gjprice'. The variable is selected in the left-hand list. The Properties window displays the following attributes:

Property	Value
Description	
ID	gjprice
Label	gjprice
Plural Label	gjprices
Misc	
Accessors	
Default Value	0
SType	FLOAT
Values	
Gather Data	false
Units
